WISSEN & INNOVATION W3

Digital. Ein Forschungsteam entwickelt ein 3-D-Modell der unzähligen Graffiti am Donaukanal: um die kurzlebigen Werke zu bewahren und eine Basis für andere Forschungen schaffen. Zu Besuch bei einer der längsten Graffitiflächen der Welt.

Buntes Erbe zum Lachen, Ärgern und Grübeln

VON ALICE SENARCLENS DE GRANCY

Wir haben seit fast vier Jahren einen Hund und gehen mit ihm oft im Prater spazieren, aber auch entlang des Donaukanals“, erzählt Geert Verhoeven von der Idee zu seinem aktuellen Forschungsprojekt. Dabei betrachtete er die Graffiti an den Wänden – „manche waren weniger schön, manche wirkten wie Kunst“ – und bemerkte auch deren Vergänglichkeit: „Sie werden teilweise nach ein paar Stunden oder Tagen übersprüht.“ Der Archäologe begann, die oft kurzlebigen Werke als Kulturerbe zu sehen, das es zu bewahren gilt, und startete gemeinsam mit dem Kunsthistoriker Stefan Wogrin und anderen wissenschaftlichen Partnern das Projekt Indigo (Inventory and Disseminate Graffiti along the Donaukanal).

„Der Donaukanal ist heute berühmt für die vielen Graffiti, dabei wissen die meisten nicht, dass Sprays eigentlich nur auf 300 Metern erlaubt ist“, erzählen die beiden Männer an diesem windigen und untypisch kalten Sommertag vor der Kaiserbadschleuse. Hier entstand 1984 neben dem Nachtclub Flex die erste legale Graffiti-fläche Wiens. Anfang und Ende sind mit einer – bunt besprühten – Reliefplatte markiert, auf der eine Taube zu sehen ist: Die sogenannte Wienerwand sei ein Unikum mit klarer Botschaft, berichtet Wogrin, der sich seit rund 20 Jahren mit Graffiti befasst – und selbst anfertigt: „Man wollte die Sprayer genauso wenig wie die Tauben.“ Dennoch ermöglicht es die Stadt Wien Künstlerinnen und Künstlern aus der Graffiti-Szene so, auf diesen Flächen zu arbeiten, ohne kriminell zu sein.

Thema lässt niemanden kalt

Denn Graffiti polarisieren bis heute. „Die einen lieben sie, die anderen hassen sie“, sagt Verhoeven, der diese Reaktionen auch von wissenschaftlichen Tagungen kennt: „Es gibt jedes Mal 100.000 Fragen.“ Das Interesse gefällt ihm – und auch, dass ein Beitrag aus seiner Forschungsgruppe im März einen Best Paper Award bei einer Konferenz

Außergewöhnlicher Kulturschatz: Geert Verhoeven (l.) und Stefan Wogrin vor einem ihrer Forschungsobjekte.

(Jens Metzger)

im italienischen Mantua gewonnen hat. Üblicherweise befasst er sich als stellvertretender Leiter des Ludwig-Boltzmann-Instituts (LBI) für Archäologische Prospektion und Virtuelle Archäologie mit ganz anderen Kulturschätzen: Er begleitete die Forschungen rund um das jungsteinzeitliche Stonehenge, war bei den Arbeiten zum römischen Carnuntum oder der Wikinger-

Fundstätte Birka dabei. „Und im Stephansdom habe ich Fresken dokumentiert und publiziert“, schildert Geert Verhoeven, der 2010 innerhalb von vier Tagen sein Haus in Belgien verkauft hat und für die Forschungsstelle nach Wien gezogen ist. Die am LBI genutzten und weiterentwickelten Messsysteme und Simulationsmethoden bilden die Klammer über die verschiedenen Themen. Ziel ist stets, Kulturerbe digital festzuhalten.

Digitaler Spaziergang am Kanal

Diese virtuellen Werkzeuge sollen nun auch helfen, die Graffiti am Donaukanal darzustellen – auch Anwendungen für den Tourismus sind denkbar: Den Forschern schwebt ein digitaler Spaziergang am Donaukanal vor, bei dem man auch ältere, an einer Stelle vorhandene Graffiti anschauen und mehr über sie erfahren kann.

Doch noch sind große technische Hürden zu nehmen: Die Far-

ben bei ständig wechselnden Lichtverhältnissen richtig abzubilden, sei sehr schwierig, führt das Duo aus. Auch die Orte ändern sich: „Die Container da drüben waren vor fünf Monaten noch nicht da“, sagt Wogrin und zeigt auf die bunt besprühten Quader am anderen Ufer. Zumindest einmal pro Woche geht er daher den Kanal ab dem Hundertwasserhaus bis zur Friedensbrücke auf beiden Seiten ab, sichtet Neuheiten und macht unzählige Fotos, die später zum großen Ganzen kommen.

Rund 27.000 Fotos bildeten das Basismodell. Seither werden – wie bei einem Puzzle – ständig neue hinzugefügt und beschrieben: Welche Figuren sind dargestellt, was steht geschrieben? Gewaltige Datenmengen müssen richtig verknüpft werden. Dabei unterstützen auch Forschungsteams der TU Wien und der Universität Politècnica de Valencia in Spanien. Auch das VRVis, das Zentrum für Virtual

Reality und Visualisierung in Wien, soll künftig helfen, das Neuland zu erröndern. „Es gibt noch keine Projekte, die können, was wir brauchen“, erläutert Verhoeven.

Schließlich soll, unterstützt vom Förderprogramm Heritage Science Austria der Österreichischen Akademie der Wissenschaften, ein öffentlich zugängliches Archiv entstehen, das weltweit kein Pendant findet. Der Donaukanal sei, zusammen mit der Berliner Mauer, wohl die längste ununterbrochene Graffiti-fläche der Welt, so Verhoeven – und in Bezug auf die Graffiti-Forschung „definitiv die längste“. Die Daten sollen dann Disziplinen wie Soziologie, Linguistik, Kriminologie oder Kunstgeschichte für ihre Forschung offenstehen.

Putin, dargestellt als Hitler

Inhaltliche Analysen folgen also später, doch aus seinen Beobachtungen weiß Wogrin schon heute: „Die Motive haben oft einen Bezug zum Kanal. Man sieht viele Fische oder Fischeknochen oder auch Oktopusse.“ Für politische Botschaften werde meist mit Schablonen gearbeitet, so ließen sich Parolen schnell aufsprühen. Darin habe man zuletzt auch den Beginn des Ukraine-Kriegs gespürt, fand Putin als Hitler dargestellt und einzelne Säulen mit den Farben der Ukraine gelb-blau bemalt. Aber es gibt Graffiti, die für noch mehr Diskussionsstoff sorgen: „Was tun mit homophoben oder nationalsozialistischen Botschaften?“, fragt Verhoeven. „Als Forscher wollen wir alle Daten anbieten, aber freilich keine Bühne für Neonazis sein.“

Überdies soll ein Thesaurus entstehen, der die Terminologie erklärt und vereinheitlicht. „Ist es Street-Art oder Graffiti? Sind es Writers, Creators oder Küsser, die hier wirken?“, verdeutlicht Wogrin offene Fragen. Bis zum Projektende im Juli 2023 wird die Datenbank jedenfalls noch ordentlich wachsen. Er hoffe, dass das Projekt dann immer noch gefördert werde, sagt Verhoeven. Denn er will das Neuland hier am Kanal, auf das ihn einst sein Hund geführt hat, weiter für die Nachwelt dokumentieren.

Boat tours Levin Statzer Foundation

Eine neue Schifffahrt der MS Blue Danube bringt den Passagieren die Graffitis entlang des Donaukanals näher.

Dienstag, 30. August 2022
Verfasst am 30.08.2022 von W24 Redaktion

Die Ufer des Donaukanals sind im Bereich der Inneren Stadt nahezu durchgängig mit Graffitis verziert. Sie bilden somit ein Museum der besonderen Art und die wahrscheinlich längste Open Air-Galerie Österreichs. Auf der Street Art River Cruise können Interessierte jetzt jeden Sonntag die Kunstwerke bestaunen und Wissenswertes dazu erfahren.

KEY WORDS: graffiti, heritage science, image-based modelling, laser scanning, photography, street art, structure from motion

ABSTRACT:

Graffiti is a short-lived form of heritage balancing between tangible and intangible, offensive and pleasant. Graffiti makes people laugh, wonder, angry, think. These conflicting traits are all present along Vienna's Donaukanal (Eng. Danube Canal), a recreational hotspot – located in the city's heart – famous for its endless display of graffiti. The graffiti-focused heritage science project INDIGO aims to build the basis to systematically document, monitor, and analyse circa 13 km of Donaukanal graffiti in the next decade. The first part of this paper details INDIGO's goals and overarching methodological framework, simultaneously placing it into the broader landscape of graffiti research. The second part of the text concentrates on INDIGO's graffiti documentation activities. Given the project's aim to create a spatially, spectrally, and temporally accurate record of all possible mark-makings attached in (il)legal ways to the public urban surfaces of the Donaukanal, it seems appropriate to provide insights on the photographic plus image-based modelling activities that form the foundation of INDIGO's graffiti recording strategy. The text ends with some envisioned strategies to streamline image acquisition and process the anticipated hundreds of thousands of images.

1. INTRODUCTION

Graffiti and street art are multifaceted, 'self-authorised' (Blanché, 2015) forms of personal expression that exploit the public space using a visual intervention. Graffiti and street art have found their detractors and admirers, their collectors and destroyers, and even their superstar artists. In the past three decades, there has been a considerable expansion of the techniques in which those 'graffitists' express themselves in the public sphere: from graffiti writing to murals, cut-outs, stencils and stickers (Monschein-Oberreither, 2019).

This ever-evolving nature and constant need to reinvent itself are characteristic of graffiti and street art (Lewisohn, 2009; Künvall, 2014), but they also explain the lack of scholarly agreement on the scope of these terms. This paper considers 'graffiti' to be the umbrella term for all mark-making practices, including engravings, paintings, sprayings, stickers, and other personal expressions attached to public (urban) surfaces in legal or illegal ways. This definition allows us to state that graffiti have been created for millennia (Lovata and Olson, 2015).

Despite its long history, the phenomenon remains fascinating and debatable because it continually fluctuates between tangible and intangible heritage, between vandalism and art, between graphical and textual, between legal and illegal, between subversive and humorous, between pleasingly acceptable and socio-political criticism. These contradicting features are also present along the Donaukanal (Eng. Danube Canal) in the city centre of Vienna (Austria). The public surfaces surrounding this central waterway have constituted a graffiti hotspot since the early 1980s (Ringhofer and Wogrin, 2018), with works ranging

from colourful murals, anarchistic symbols on bridge pillars to bike stand writings (Figure 1).

Figure 1. The large variation in graffiti at the Donaukanal.

Every day, new graffiti appear along the Donaukanal. However, a graffiti's mere creation automatically implies the (complete or partial) destruction of one or more existing graffiti beneath. Although graffiti are subject to similar post-depositional processes found on archaeological sites and in landscape formation, one does usually not 'excavate' a graffiti-scape. Pre-existing graffiti simply become a lost and forgotten part of the Anthropocene's global stratification (Edgeworth et al., 2014).

That is why in the summer of 2020, the idea arose to monitor, digitally safeguard, and analyse a large part of this unique, complex, ever-changing, and socially fascinating cultural heritage that flanks Vienna's central waterway. More than a year

KEY WORDS: image and video stabilisation, motion blur, accuracy potential, camera calibration, interior orientation

ABSTRACT:

Image stabilisation (IS) is a family of approaches whose aim is to reduce motion blur in still images and shaking effect in video frames. A variety of techniques are currently implemented in cameras and camcorders: some involve hardware solutions, other are software approaches. In general, IS for still photography entails hardware in-camera or in-lens solutions. Video stabilisation, on the other hand, can be accomplished with software algorithms, either in real-time within the camera or in post-processing. Whereas IS aids photography and video making, its influence on the photogrammetric 3D modelling process has not been investigated. This article addresses this aspect. To this purpose, several laboratory and real-world tests were carried out, whose results showed that IS must be disabled when accuracy matters in photogrammetric projects. Details are provided in the manuscript.

1. INTRODUCTION

Many factors contribute to the sharpness of an image: the wavelength of the imaged electromagnetic radiation, the size of the lens aperture (the primary influencer of depth of field and the amount of diffraction softening), incorrect focusing, monochromatic lens aberrations (such as coma, astigmatism, and spherical aberration), longitudinal/axial and transverse/lateral chromatic aberrations, the amount and type of image noise plus possible denoising measures. Finally, there are also various causes for motion-induced unsharpness. This paper mainly focuses on the latter.

Unsharpness due to motion is either caused by movement of the object scene to be photographed or motion of the camera (known as camera shake). Camera shake is not only present when shooting from very dynamic platforms like aeroplanes, satellites, UAVs, or cars, but even applicable when photographing hand-held as user tremor can result in vibrations whose magnitude is too big to be counteracted by the shutter speed. This hand-shake induced blur worsens with longer focal length lenses. To still obtain a sharp image from a hand-held camera and lens combination, the general rule-of-thumb is that the exposure time should be equal or shorter than the reciprocal of the 35mm format equivalent focal length in use. As an example: a 50 mm lens necessitates a shutter speed of at least 1/50 s. In photography, this guideline is known as the reciprocal rule.

In situations where the object/scene is static, several techniques exist to extend this exposure time (i.e. slowing down the shutter speed): either via extra camera support (passive like a tripod or active via a gimbal) or exploiting a function available in most photographic systems, i.e. the image stabilisation. Although this function can mean the difference between a blurry picture and a sharp one, its use in photogrammetric image acquisition is usually discouraged as it continuously changes the camera's interior orientation. This paper wants to check if this advice is valid by delving into image stabilisation techniques and

quantifying their possible negative influence on the photogrammetric process.

1.1 Image stabilisation techniques

The term image stabilisation (IS) refers to a range of techniques developed to reduce motion blur in images and frame-to-frame jitter in videos (Figure 1).

A first, basic distinction can be made between hardware and software stabilisation. In the first case, it is referred to as optical stabilisation (OIS), which can take place in the lens (lens-based IS), in the camera body on the imaging sensor (sensor-shift or in-body IS) or via a combination of the two methods (dual IS).

The different OIS techniques are named differently depending on the camera manufacturer. For example, the in-lens IS implemented by Nikon is called vibration reduction (VR), while Canon dubs its system image stabilizer (IS).

Software stabilisation implemented in some video cameras can perform in real-time and it is called digital IS (DIS) or electronic IS (EIS). If, on the other hand, videos are edited in post processing (offline), then stabilisation algorithms, also known as stabilisation filters, are used.

While OIS is effective in reducing blur due to the motion of a camera, including involuntary hand shaking, EIS does not solve the problem of motion blur but improves the smoothness of the video by reducing the trembling or jitter between frames.

OIS uses sensors, such as gyroscopes, to detect camera movement and actuators to move the lens and/or sensor to counteract the motion. Over time, systems have evolved from techniques based on inertial sensors arranged on 2-axis to current 5-axis methods such as those implemented in Olympus or Sony. In EIS, gyroscopes or accelerometers are also employed to measure hand jitter and the frames are shifted by a commensurate number of pixels. EIS requires the frames to be cropped with respect to the full sensor size, as the sensor edges are used as buffer zones to compensate for the motion (Sachs et al., 2006).

AUTOGRAF—AUTomated Orthorectification of GRAffiti Photos

Benjamin Wild ^{1,*}, Geert J. Verhoeven ², Martin Wieser ³, Camillo Ressel ¹, Jona Schlegel ², Stefan Wogrin ⁴, Johannes Otepka-Schremmer ¹ and Norbert Pfeifer ¹

¹ Department of Geodesy and Geoinformation, TU Wien, 1040 Vienna, Austria
² Ludwig Boltzmann Gesellschaft—LBI ArchPro, 1190 Vienna, Austria
³ Independent Researcher, Vienna, Austria
⁴ SprayCity, Austria; Vienna, Austria
 * Correspondence: benjamin.wild@tuwien.ac.at

Abstract: Admired and despised, created and destroyed, legal and illegal: Contemporary graffiti are polarising, and not everybody agrees to label them as cultural heritage. However, if one is among the steadily increasing number of heritage professionals and academics that value these short-lived creations, their digital documentation can be considered a part of our legacy to future generations. To document the geometric and spectral properties of a graffiti, digital photographs seem to be appropriate. This also holds true when documenting an entire graffiti-scape consisting of 1000s of individual creations. However, proper photo-based digital documentation of such an entire scene comes with logistical and technical challenges, certainly if the documentation is considered the basis for further analysis of the heritage assets. One main technical challenge relates to the photographs themselves. Conventional photographs suffer from multiple image distortions and usually lack a uniform scale, which hinders the derivation of dimensions and proportions. In addition, a single graffiti photograph often does not reflect the meaning and setting intended by the graffitist, as the creation is frequently shown as an isolated entity without its surrounding environment. In other words, single photographs lack the spatio-temporal context, which is often of major importance in cultural heritage studies. Here, we present AUTOGRAF, an automated and freely-available orthorectification tool which converts conventional graffiti photos into high-resolution, distortion-free, and georeferenced graffiti orthophotomaps, a metric yet visual product. AUTOGRAF was developed in the framework of INDIGO, a graffiti-centred research project. Not only do these georeferenced photos support proper analysis, but they also set the basis for placing the graffiti in their native, albeit virtual, 3D environment. An experiment showed that 95 out of 100 tested graffiti photo sets were successfully orthorectified, highlighting the proposed methodology's potential to improve and automate one part of contemporary graffiti's digital preservation.

Keywords: graffiti; cultural heritage; orthophoto; photogrammetry; street-art; structure from motion; georeferencing

1. Introduction

Graffiti are an ephemeral yet ubiquitous phenomenon. Although sometimes only existing for several hours or days, one cannot avoid seeing graffiti in urban environments. Graffiti are polarising. They upset, please, provoke, and sometimes even insult individuals or societies. Often graffiti creators do not even intend to infuriate, but the mere existence of their works triggers human emotions.

Despite or maybe even because of their omnipresence and polarising nature, documentation of 'contemporary' graffiti, in contrast to 'ancient graffiti' such as inscriptions on the urban walls of Roman Pompeii, has never received much scientific attention [1,2]. Even in their overview and position paper on the academic legitimacy of

Acquiring centimetre-accurate camera coordinates in project INDIGO

Martin Wieser | Independent researcher | scene2map@gmail.com
Geert Verhoeven | LBI ArchPro | geert.verhoeven@archpro.lbg.ac.at
Benjamin Wild | Technische Universität Wien | benjamin.wild@geo.tuwien.ac.at

INDIGO is funded by the Heritage Science Austria programme of the Austrian Academy of Sciences (ÖAW)

3rd Heritage Science Austria meeting: 23 September 2022

(1) Mount device

The camera's hot shoe is used for mounting and camera synchronisation

(2) Configure RTK

Input RTK provider (e.g. EPOSA)
Provide settings for correction data

(3) Prepare camera

Set and fix focusing
Deactivate electronic and optical image stabilisation

(4) Acquire photos

Follow a specific set of rules:
- oblique & perpendicular photos
- no change in focus or zoom
- different subject distances
- cover entire image sensor

(5) Download device data

Download camera positions & rotations over WiFi from the device's webserver via a browser

(6) Process device data & photos

Use the logged camera positions to georeference and scale the photo network
With many photos, centimetre accuracy is achievable

(7) Create products

From the georeferenced photo network a 3D mesh, point cloud or orthophotos can be produced in the desired CRS

RTK GNSS receiver
GPS & Galileo satellites
L1/L2/L5 multi-band
RTK

IMU
3-axis gyroscope
3-axis accelerometer
3-axis magnetometer

Position

Rotation

Feedback
LEDs & status display

GNSS: Global Navigation Satellite System
EPOSA: Echtzeit-Positionierung-Austria
CRS: Coordinate Reference System
IMU: Inertial Measurement Unit
GPS: Global Positioning System
RTK: Real-Time Kinematic

Use the logged camera positions to georeference and scale the photo network
With many photos, centimetre accuracy is achievable

Download camera positions & rotations over WiFi from the device's webserver via a browser

How project INDIGO automatically turns graffiti photos into orthophotomaps

Benjamin Wild | Technische Universität Wien | benjamin.wild@geo.tuwien.ac.at
Geert Verhoeven | LBI ArchPro | geert.verhoeven@archpro.lbg.ac.at
Martin Wieser | Independent researcher | scene2map@gmail.com
Stefan Wogrin | SprayCity | stefan.wogrin@spraycity.at
Norbert Pfeifer | Technische Universität Wien | benjamin.wild@geo.tuwien.ac.at

INDIGO is funded by the Heritage Science Austria programme of the Austrian Academy of Sciences (OAW)

3rd Heritage Science Austria meeting: 23 September 2022

1 - Why orthophotomaps?

Conventional photographs suffer from various distortions:

- (1) Perspective distortions
- (2) Topographic distortions
- (3) Lens distortions (not well visible but they exist!)

Orthophotomaps have the distortions removed, making them:

- Distortion-free
- High-resolution
- Georeferenced

maps of graffiti

2 - How to make them?

Four types of data are required:

- a set of graffiti-specific photographs
- the camera orientations (interior and exterior)
- a 3D model of the graffiti-covered surface
- a reference plane to project the orthophotomap on

3 - INDIGO's AUTOGRAF tool

To automatically generate orthophotomaps from 1000s of photos, the open-source tool **AUTOGRAF** was developed within INDIGO [Automated Orthorectification of Graffiti photos]

4 - The 100-graffiti test

AUTOGRAF was tested on a sample dataset of **826 images** corresponding to **100 graffiti** along the Donaukanal

97% of the tested graffiti were successfully orthorectified

AUTOGRAF needed < 6min to process one graffiti photo set

The average orthophotomap raster cell size is below 1mm

Architecture Image Studies - Narrative Architecture

Much of the work published here was initially exhibited in a series of exhibitions, most recently as part of the Shanghai Urban Space Art Season 2019 in the exhibition 'Sensorium'. Through the production of these drawings and texts, the contributors seek to align themselves with a tradition of visionary narratives and use the multiple platforms of dissemination to communicate those ideas to a wider set of audiences beyond architectural academia.

[symposia](#)

INDIGO is an open-data and open-access project, operating according to the [FAIR principles](#). Whereas all project data will become available at the project's end via the [ARCHE data repository](#), any scientific output can be found at different locations:

- INDIGO's [Zenodo community](#)
- a dedicated [ResearchGate project page](#)
- **here!** Below, one finds all relevant info and links to INDIGO's soft- and hardware, oral and poster presentations, publications and symposia. Each section is directly accessible via the menu above.

software

The INDIGO team created **COOLPI** and **AUTOGRAF**, two software packages that are free to download from the [INDIGO's GitHub account](#).

- the **CO**lour **O**perations **L**ibrary for **P**rocessing **I**mages (**COOLPI**) is an open-source Python toolbox including procedures for the colour correction of RAW photos. The [code](#) comes with an extensive [manual](#).
- **AUTOGRAF** (**AU**Tomated **O**rthorectification of **GRA**ffiti photos) is an open-source python-based Metashape add-on to automatically orthorectify (graffiti) photos. Its source code can be found [here](#).

hardware

The INDIGO team has developed a device to record the camera's exact 3D position and angular rotation in space at the moment of photo acquisition. This so-called **exterior orientation** is helpful

How project INDIGO automatically turns graffiti photos into orthophotomaps

Wild, Benjamin; Verhoeven, Geert Julien; Wieser, Martin; Wogrin, Stefan; Pfeifer, Norbert;

Graffiti are a short-lived and polarising form of cultural heritage. The graffiti-focused research project INDIGO, funded by ÖAW, documents and digitally preserves (almost) every graffiti created along Vienna's Donaukanal, one of the world's largest graffiti hotspots. A central aim

project INDIGO

the two-year INDIGO project aims to build the basis to systematically document | disseminate | analyse almost 13 km of uninterrupted graffiti along Vienna's Donaukanal (Eng. Danube Canal) in the next decade

graffiti community engagement and regular photo visits allow INDIGO to build a spatially, spectrally, and temporally accurate record of most (il)legal sprayings, engravings and other personal expressions on the Canal's public urban surfaces

a spatial database manages all images and relevant metadata like style, artist pseudonym and creation data, while the involvement of graffiti creators and scholars safeguard (meta)data correctness and completeness

this database feeds a free online platform that empowers everyone to explore (through virtual walks or displaying the change of graffiti through time) and analyse (via spatio-temporal-semantic queries) all graffiti records

storage in a certified repository ensures the necessary digital longevity and free download of all data, so that INDIGO can realistically preserve and disseminate society's thoughts and artistic expressions marked upon its walls

Short Description

AUTOGRAF (AUTomated Orthorectification of GRAffiti photos) is an open-source python-based Metashape add-on which enables the automated orthorectification of graffiti photos at a specific site of interest. It employs state-of-the art photogrammetric computer vision techniques to allow highly accurate georeferencing and orthorectification of large numbers

INDIGO Toolbox

1. Choose graffiti directory to be processed

2. Run

- Processing times:
 - ca. 1800 photos (ca. 220 graffiti) per day

This is an early access version, the complete PDF, HTML, and XML versions will be available soon.

COOLPI

Description

COLOUR Operations Library for Processing Images (COOLPI) is an open-source toolbox programmed in Python for the treatment of colorimetric and spectral data. It includes classes, methods and functions developed and tested following the colorimetric standards published by the Commission Internationale de l'Éclairage (CIE, 2018).

The COOLPI package has been developed as part of the INDIGO project (Inventory and Disseminate Graffiti along the Danube) carried out by the Ludwig Boltzmann Institute for Archaeological Prospection and Virtual Archaeology in close collaboration with the GEO Department of TU Wien University.

Alert

The dependencies should have been installed automatically along with COOLPI. Please check that everything is correct.

3 CIE

The Commission Internationale de l'Éclairage (CIE) establishes standards of response functions, models and procedures of specification relevant to photometry, colorimetry, colour rendering, visual performance and visual assessment of light and lighting (CIE, Division 1: Vision and Colour).

The COOLPI package follows in a rigorous manner the recommendations published by the CIE concerning the standard colorimetric observers, illuminants, the computation of tristimulus values, the colour space conversions formulae and colour difference equations among other colorimetric practices (CIE, 2018).

The CIE objects implemented into the COOLPI package are based on the abstract class *CIE*, and can include other abstract classes according to their requirements. The *CIE* main classes are: *Observer*, *SComponents*, *CMF*, *CFB*, and *RGBCMF*.

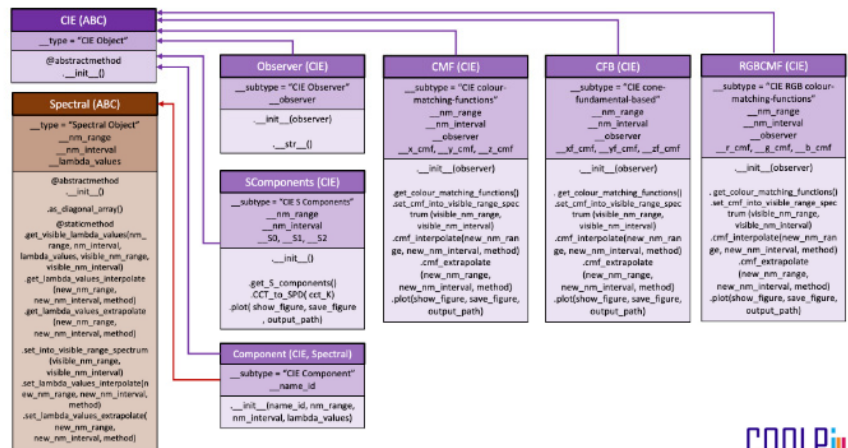

Figure 2: UML Diagram for the CIE classes

Info

For further explanation of some of the calculations applied, we highly recommend users to consult the standards published by the CIE, particularly the Technical Report CIE 015:2018, Colorimetry, 4th Edition (CIE, 2018). This publication provides the recommendations of the CIE concerning colorimetry, particularly the use of the standard colorimetric observers and standard illuminants, colour spaces, colour difference metrics and other colorimetric practices and formulae.

Practical use of CIE classes

Users are encouraged to previously take a look at the *Jupyter Notebook*:

Discussing graffiti – knowledge organisation impossible?

Jona Schlegel
Massimiliano Carloni

STATUS-QUO GATHERING

LOOKING BACK | AHEAD

14 October 2022 Vienna, Austria

*The INDIGO graffiti project is funded by the Heritage Science Austria
programme of the Austrian Academy of Sciences (ÖAW)*

A triple concept

graffiti as
activity

"the creation of a mark"

graffiti as
objects/
graffito as
object

"the mark resulted
from graffiti as
activity"

graffiti as
style

"the mark looking
like *graffiti writing*"

Graffiti as activity

"the creation of a mark"

By human (+tool)

Done on purpose

Is a visual intervention

Real world

On all public, communal, and private surfaces

Involves the appropriation of a surface

Done with different techniques – additive or reductive

Graffiti as objects

"the mark resulted from graffiti as activity"

Anthropogenic

Has a purpose

Visual intervention

Situated in the real world

On or through any possible surface (except a private surface only accessible by the mark-maker)

Appropriated surface

In different styles with various techniques

Mark-making

(Non-) practical reasons

Graffiti as style

"the mark looking like *graffiti writing*"

Status quo -
OpenAtlas features for INDIGO

OpenAtlas - <https://openatlas.eu>

- Open source, browser based database software
 - available on GitHub: <https://github.com/craws/OpenAtlas>
- Initiated about 10 years ago by Stefan Eichert
- Now mainly developed at the ACDH-CH
- Used to acquire, edit and manage research data
- CIDOC CRM as model

CC-BY-SA 4.0, Jan Belik

OpenAtlas and INDIGO

INDIGO workshop 2021

- INDIGO's research focuses on the present time
- Different workflow: e.g. media is stored in ARCHE (<https://www.oeaw.ac.at/acdh/tools/arche>)
- Providing metadata for various applications through the API
- Each project adds features to OpenAtlas
 - cf. <https://redmine.openatlas.eu/projects/uni/roadmap>

OpenAtlas Features for INDIGO

- Implemented
 - Record production of artefacts, e.g. graffiti ([#1500](#))
 - Improved time tracking with hours, minutes and seconds ([#1574](#))
 - Improved database model to store 3D geometries ([#1631](#))
- In Progress
 - Importing INDIGO vocabulary from Vocabs ([#1663](#))
 - Display 3D geometries ([#1573](#))
 - Connecting to ARCHE to get image files ([#1575](#))
 - More detailed structure, e.g. track individual components of graffiti ([#1587](#), [#1647](#))
 - Relative chronological and spatial relation between graffiti ([#1648](#))
